Description

There are many instances in rural areas where the quality of supply is unpredictable. Even when UPS equipment is installed, large fluctuations in supply voltage can damage electronic equipment. In non-critical installations, the Tripconnect unit will simply remove power from the equipment in the event of over or under voltage conditions and automatically restore power when the supply falls within preset limits. Surge protection and full status monitoring has been included.

The single phase unit is simply inserted between the wall socket and the equipment power plug. Zero crossing has been included for smooth operation.

The three phase Tripconnect performs in the same way but has the additional feature of phase failure and phase rotation protection. Since this system is hardwired, an override switch has been provided.

- Economical protection
- Compact design
- Status monitoring
- Automatic operation
- Single or 3 phase units available
